Theme2go #1
Health Navigator

THEME installation manual - contents:

1. System-Requirements

The template was developed on the Contao LTS Version 3.2 and made to be compatible with Contao 3.4 and the new Contao LTS release 3.5. Intermediate and older versions are likely to be compatible. In most cases only an adjustment to the SQL Template will be needed.

The general system requirements of Contao are applicable. All necessary information can be found on the Contao website under the following link:

https://docs.contao.org/books/manual/3.2/en/
https://docs.contao.org/books/manual/3.4/en/
https://docs.contao.org/books/manual/3.5/en/
https://docs.contao.org/books/manual/4.3/en/
https://docs.contao.org/books/manual/4.4/en/

2. New Website

Install the theme and the demo content in a new contao installation.

2.1. Install Theme

You'll need the following files from the zip-archive:

for Contao 3.2:	optional: theme2go_health_navigator_database.3.2.sql
	theme2go_health_navigator.3.2.cto
for Contao 3.4	optional: theme2go_health_navigator_database.3.4.sql
	theme2go_health_navigator.3.4.cto
for Contao 3.5	optional: theme2go_health_navigator_database.3.5.sql
	theme2go_health_navigator.3.5.cto
for Contao 4.3	optional: theme2go_health_navigator_database.4.3.sql
	Theme2go_health_navigator.4.3.cto
for Contao 4.4	optional: theme2go_health_navigator_database.4.4.sql
	theme2go_health_navigator.4.4.cto

Please note: if you are using Contao Version 4 or higher proceed as described below in the section "Contao 4+ installation".

Step: 1 (new Contao installation)

Download the Contao version you intend to use and extract it on your local computer. Move the files into the htdocs folder of your local installation (e.g. XAMPP) or upload them to your server with an FTP program (for example: WinSCP or Filezilla). Depending on your server configuration, the public folder is most likely called htdocs, httpdocs, html or public_html.

Step: 2

Move the file „theme2go_health_navigator_database.#.#.sql" (found in the Theme2Go Theme zip file) to the „templates" folder of Contao installation (this will be needed in phase 2.2. to import the template).

Step: 3

Open the Contao install tool with the following link in your browser.
www.your-domain.de/contao/install.php/

Step: 4

Run the installation, enter your database connection parameters and follow the instructions to complete the database tables. (Please note: at this stage of the installation do not select and import the theme sql template!)

Step: 5

Under the last section "Create an admin user" set your own username and password for the Contao backend. Open the Contao backend under the following link:
www.your-domain.com/contao/ and log in with your userdata.

Step: 6

Navigate to Layout › Themes, and click on Theme import. Upload the file theme2go_health_navigator.#.#.cto, click on the button Theme import and then the button continue.

Contao 4+ Installation

Step 1 (new Contao installation)

As of Version 4.4 Contao can be installed with the **Contao Manager**. https://docs.contao.org/books/manager/de/installation-manager.html

For the Versions 4.0 - 4.3 please refer to the documentation on contao.org for installation guides. https://docs.contao.org/books/manual/4.3/en/01-installation/installing-contao.html

Step 2

Open the Contao install tool through the link in the Contao Manager or with the following link in your browser. www.ihre-domain.de/contao/install (Versions 4.0 - 4.3: www.ihre-domain.de/install.php) and accept the Contao License. (failing to do this results in the template folder, described in step 3, being unavailable)

Step 3

Move the file „theme2go_health_navigator_database.#.#.sql" (found in the Theme2Go Theme zip file) to the „templates" folder of Contao installation (this will be needed in phase 2.2. to import the template).

Step 4

Go back to the Contao install tool and run the installation, enter your database connection parameters and follow the instructions to complete the database tables. (Please note: at this stage of the installation do not select and import the theme sql template!).

Bonner Strasse 178   Email: info@cts-media.eu
50968 Köln

Step 5

Under the last section "Create an admin user" set your own username and password for the Contao backend. Open the Contao backend under the following link: www.your-domain.com/contao/ and log in with your userdata.

Step 6

Navigate to Layout › Themes, and click on Theme import. Upload the file theme2go_health_navigator.#.#.cto, click on the button Theme import and then the button continue.

2.2 SQL template import / demo content

Importing the sql template will set up the demo content and create a website like this one: http://theme2go.health-navigator.cts-media.eu/ .This step is optional and only recommended for a new website. Any existing pages, content you have created as well as settings you've made will be overwritten.

Step: 1

Open the Contao install tool again with the following link.
Contao 3.X: www.your-domain.de/contao/install.php/
Contao 4.4: www.your-domain.de/contao/install (4.0 - 4.3: www.your-domain.de/install.php)

Step: 2

In the section "import a template" choose the template: theme2go_health_navigator.#.#.sql and click on Import template.
Please note: Do not tick the box *Do not truncate tables*. All existing content will be deleted - including your admin user account and a new admin user account will be created.

Step: 3

Open the Contao back end again under the following link: www.your-domain.com/contao/

The new login data is: **Username:** admin2go
                              Passwort: passwort2go

If there are problems during the installation, please check the system requirements of Contao (as described in chapter #1). To make sure your server has the technical system requirements and all files have been copied correctly, you can install the„Contao-Check" and run it. You will find it here:

Contao 3.2 https://docs.contao.org/books/manual/3.2/en/01-installation/configuring-the-live-server.html#the-contao-check

Contao 3.4 https://docs.contao.org/books/manual/3.4/en/01-installation/configuring-the-live-server.html#the-contao-check

Contao 3.5 https://docs.contao.org/books/manual/3.5/en/01-installation/configuring-the-live-server.html#the-contao-check

Contao 4.# https://docs.contao.org/books/manual/4.4/en/01-installation/

3. Applying the theme to an existing website

If you wish to use the theme on an existing website you will only need file theme2go_health_navigator.#.#.cto for your Contao version from the zip-archive. The # stands for the contao version.

Navigate to Layout › Themes, and click on Theme import. Upload the file theme2go_health_navigator.#.#.cto, click on the button Theme import and then the button continue.

Please note: <u>Do not</u> import the SQL template (.sql Datei/Datenbank)! Importing the template as described above in Step 2.2 will replace your existing pages and content with the Theme2Go Demo website.

4. Change color scheme

Color

Navigate to Layout › Themes, and click on the edit symbol (pencil) of the Theme2Go Theme. The window pictured below will open. Under the topic global variables you can change the

hex-color-code (only the 6 numbers/letters <u>without</u> the #). **Note:** the variable $high sets the RGB-Value of the box-shadow around active form fields.

Font / Schriftart

($font) If you would like to use a different font (eg. implement a different google font with the layout settings) then swap the value of the variable $font for the name of your own font. Remember to use quotations around the name of the font if it normally need them in CSS.

Please note! Only change values. Changing a key or deleting a variable can cause the theme to malfunction.

These are the colors governed by the global variables:

$col1a	#98d129
$col1b	#8ac419
$col1c	#a4e02e
$col2a	#574844
$col3a	#f4f4f4
$col3b	#dedede
$col3c	#cecece
$colFB	#4A6EA9
$colTW	#33CCFF
$colG+	#DA4835
$col99	#FFFFFF
$highL	rgb(152,209,41)

5. Adjust Header Elements

5.1 Hide/Show Social-Network-Links, Search, Login

Navigate to Layout › Themes and click on the symbol shown below to open the Layouts menu.
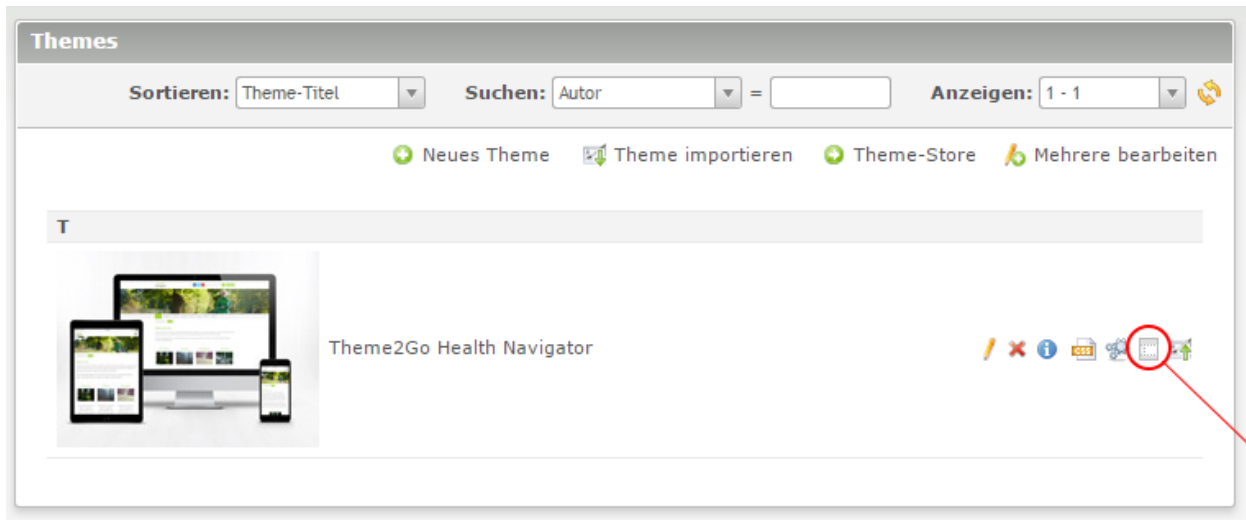

The theme has two layouts. For a uniform look it makes sense to make the same adjustments to both layouts. Click on the pencil symbol as shown below to open the layout.
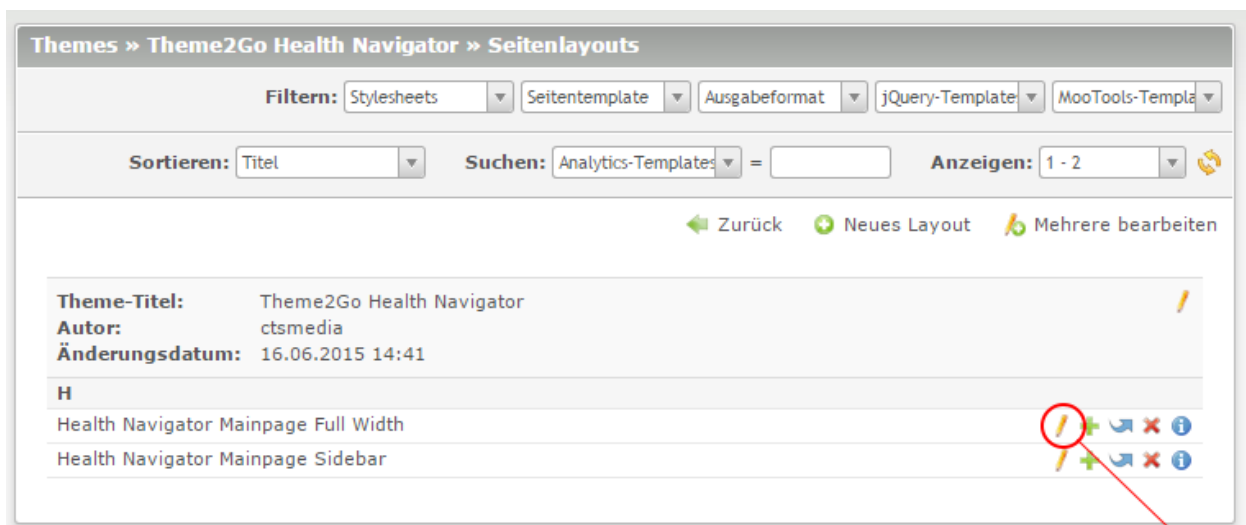

Click on the eye symbol next to the module you would like to hide. The Social-Network.Icons (header-social), search field (header-search) or login button (header-login) can be easily hidden or shown as you prefer.

5.2 Change the logo.

Your logo should be a PNG with a transparent background. Navigate to System › File Manager.
Navigate in the file system to the the folder:
theme_health_navigator › images › layout_images › icons › logo-header.png

To replace this simply upload your own image with the same name to the folder described above. You can also edit the frontend module *Header Logo* and change the path your own logo. Optimally the name of your image should be descriptive, eg. your company name or the text from your logo.

5.3 Setting up a Header Image

To ensure that the header image adjusts responsively to different display sizes we recommend using the gallery element. Create a new article for your header image and set it to be displayed in "Header". Give it the class "headerimage" (see the figure below).

Now create an element in the new article and set it to the element type gallery. Choose one or more pictures to display in the header area.

Repeat these steps or copy the article for all the pages displaying a header image.

To ensure optimal rendering on HD-Screens we recommend using images with a width of at least 1920 pixels and a height of at least 300 pixels. For example: the images in the Theme-Demo are 1920x724 pixels. The images will be centered in the header and, depending on the screen size and aspect ratio of your images, parts of the image above and below or left and right will not be displayed.
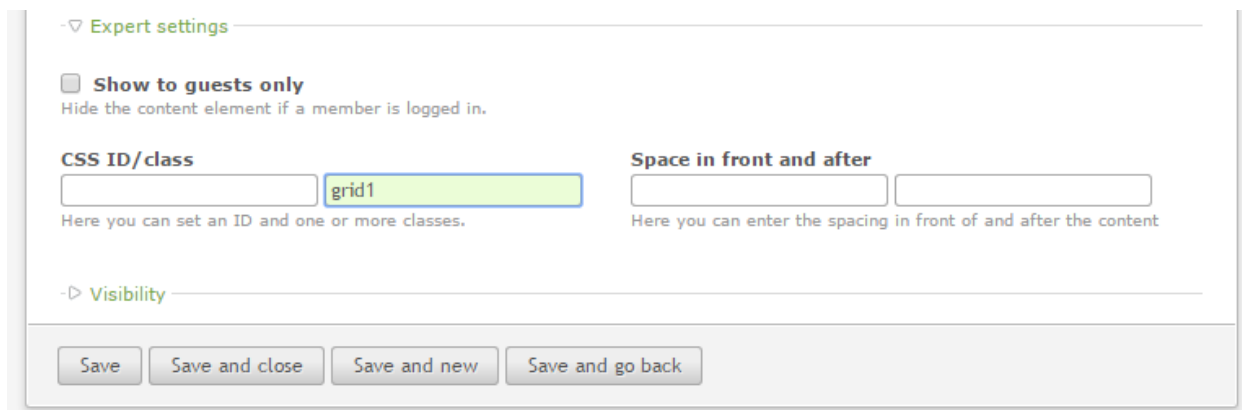

6. grid classes (columns)

With the grid system you can display content in up to four columns. To do this give the articles you want displayed next to each other in columns a grid class (see image below). The following three grid classes are available:

grid1 = one quarter wide (one of four columns)
grid2 = one half (two quarters) wide
grid3 = three quarters wide.

Combine different classes together to show columns with different widths. For example:
4x grid1
1x grid2 + 2x grid1
1x grid3 + 1x grid1

7. Copyright

If you have purchased the theme with the option "Without copyright notice of the designer" you may edit or remove the Copyright notice.

Navigate to Layout › Themes and click on the layout icon symbol to open the Layouts menu (See also section 5.1: Adjust Header Elements). The theme has two layouts. Click on the pencil symbol as shown below to open the layout. Find the module named "Copyright" in the list of frontend modules and click on the eye symbol next to it to hide it. Click on the pencil icon if you would like to edit it.

8. Contao 4

To make icons and images display properly the theme folder has to be made public. From Contao 4.0 onwards files in the file system are not public by default. Navigate to the file manager and click on the pencil icon of the theme folder "theme_health-navigator" to see the screen below where you can set the folder to public.

File manager » files/theme_health-navigator

⬅ Go back

Name*

theme_health-navigator

File location: files/theme_health-navigator

☑ **Public**
Make the folder and its sub-folders accessible via HTTP.

9. FAQ

Header-Bild

Can I change the width of the header image so that its not the full width of the screen (eg. es wide as the navigation)?

There aren't settings for this within the theme but you are welcome to make changes to the css to accomplish this. Most likely you'll need to add new attributes to the class .headerimage and probably a media query so that the images remain responsive on smaller screens. Please take into account that whatever changes you make may produce unwanted side effects. (see also item 5.3)

```
z.B.
.headerimage {
   width: 960px;
   margin: 0 auto;
}
@media screen and (max-width: 960px) {
   .headerimage {
      width: 100%;
   }
}
```

My header images are blurry.

Our recommended image size for the header images is 1920 x 724px. In this size the images will be displayed nicely on most modern monitors. If your images are less than 1920px wide they will be enlarged on screens with a higher screen resolution (eg HD) and will look blurry. (see also item 5.3)

Column Layout

How can I align my content into columns?

We've implemented some grid classes for you to get you started (see item 6). We really recommend not using tables for layout purposes because they generally break the responsive nature of the theme (Tables with fixed width don't adjust to smaller screen sizes).

Copyright

*I bought the Theme without the copyright notice but is still displayed in the footer.*
Yep. Its always there by default but you can easily take it out or even revise it for your own purposes. See item 7 for the relevant instructions.

Favicon

How do I change the favicon?
There are two ways to do this:

1. Swap the favicon.ico file against your own. In the demo content we use a very simplified favicon and you can swap the .ico file against your own. You'll find it under images/layout_images/icons.
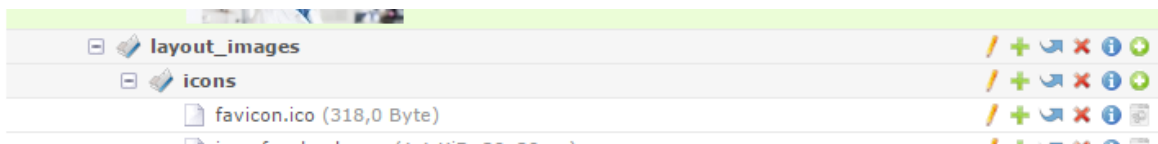

2. Change the <head>-Tags. The favicon is included with the "additional <head>-Tags" setting in the layouts. You can change the tag here with your own custom tags. (Remember to change
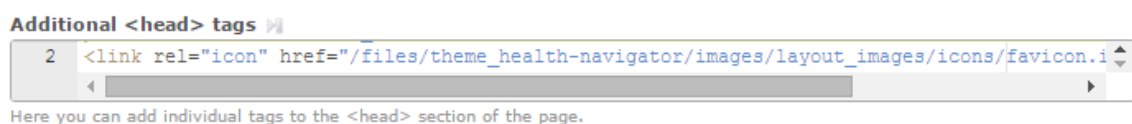

<head>-Tag in both/all the layouts!).

Google-Maps bearbeiten

If you've made a change to the Google Maps Elements and it isn't showing on the Frontend any more, then it probably means that the iframe Tag is not being permitted by contao. Go to Settings in the backend and open the panel Security Settings. Under Allowed HTML Tags type in <iframe> at the start of the input field and save the settings
